

4-Points Congruent Sets for Robust Pairwise Surface Registration

Niloy J. Mitra

Correspondence Problem Classification

How many meshes?

- **Two:** Pairwise registration
- **More than two:** multi-view registration

Initial registration available?

- **Yes:** Local optimization methods
- **No:** Global methods

Class of transformations?

- **Rotation and translation:** Rigid-body
- **Non-rigid deformations**

Problem Statement

Given: Two models

Global Shape Matching: 4PCS

Problem Statement

Goal: *Automatically* align the models

Why is this Hard?

Given: Two scans

- corrupted with *noise* and *outliers*
- in arbitrary initial poses with *unknown overlap*

RANSAC for Line Fitting

Observations:

- Problem can be solved by a small number of (correct) points, e.g., 2 in line fitting
- Easy to verify solution (error measurement)

Let p be the probability of (random) picking a correct point

Probability of getting correct result in k tries

$$(1 - p) \quad (1 - p)^k \quad \text{Prob. of success: } 1 - (1 - p)^k$$

Aligning with Feature Points

Why not Denoise Scans?

de-noise,
compute FP-s,
align

align with 4PCS,
de-noise

Key Observation

A pair of triples (from P and Q) is enough to uniquely define a *rigid transform* $O(n^3)$

Surprisingly, a *special set of 4-points, congruent sets*, makes the problem simpler $O(n^2)$

4-Points Congruent Sets

Key Observation

A pair of triples (from P and Q) is enough to uniquely define a *rigid transform* $O(n^3)$

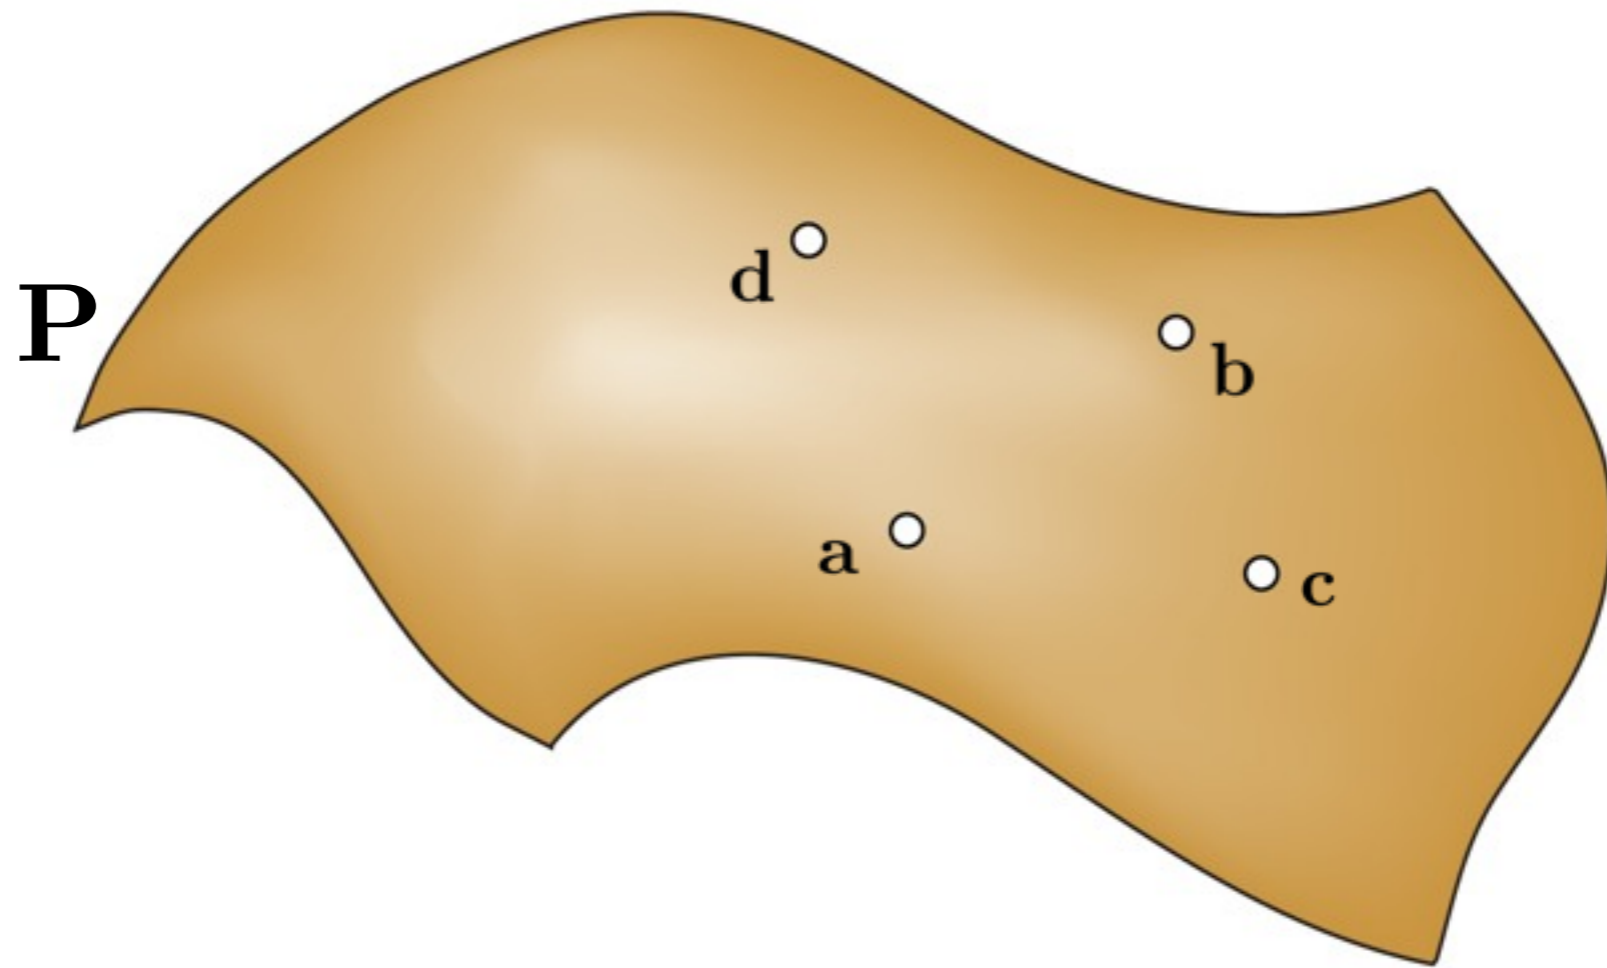

Surprisingly, a *special set of 4-points, congruent sets*, makes the problem simpler $O(n^2)$

Affine Invariance

Affine Invariance

Affine Invariance

4 coplanar points

Affine Invariance

Affine Invariance

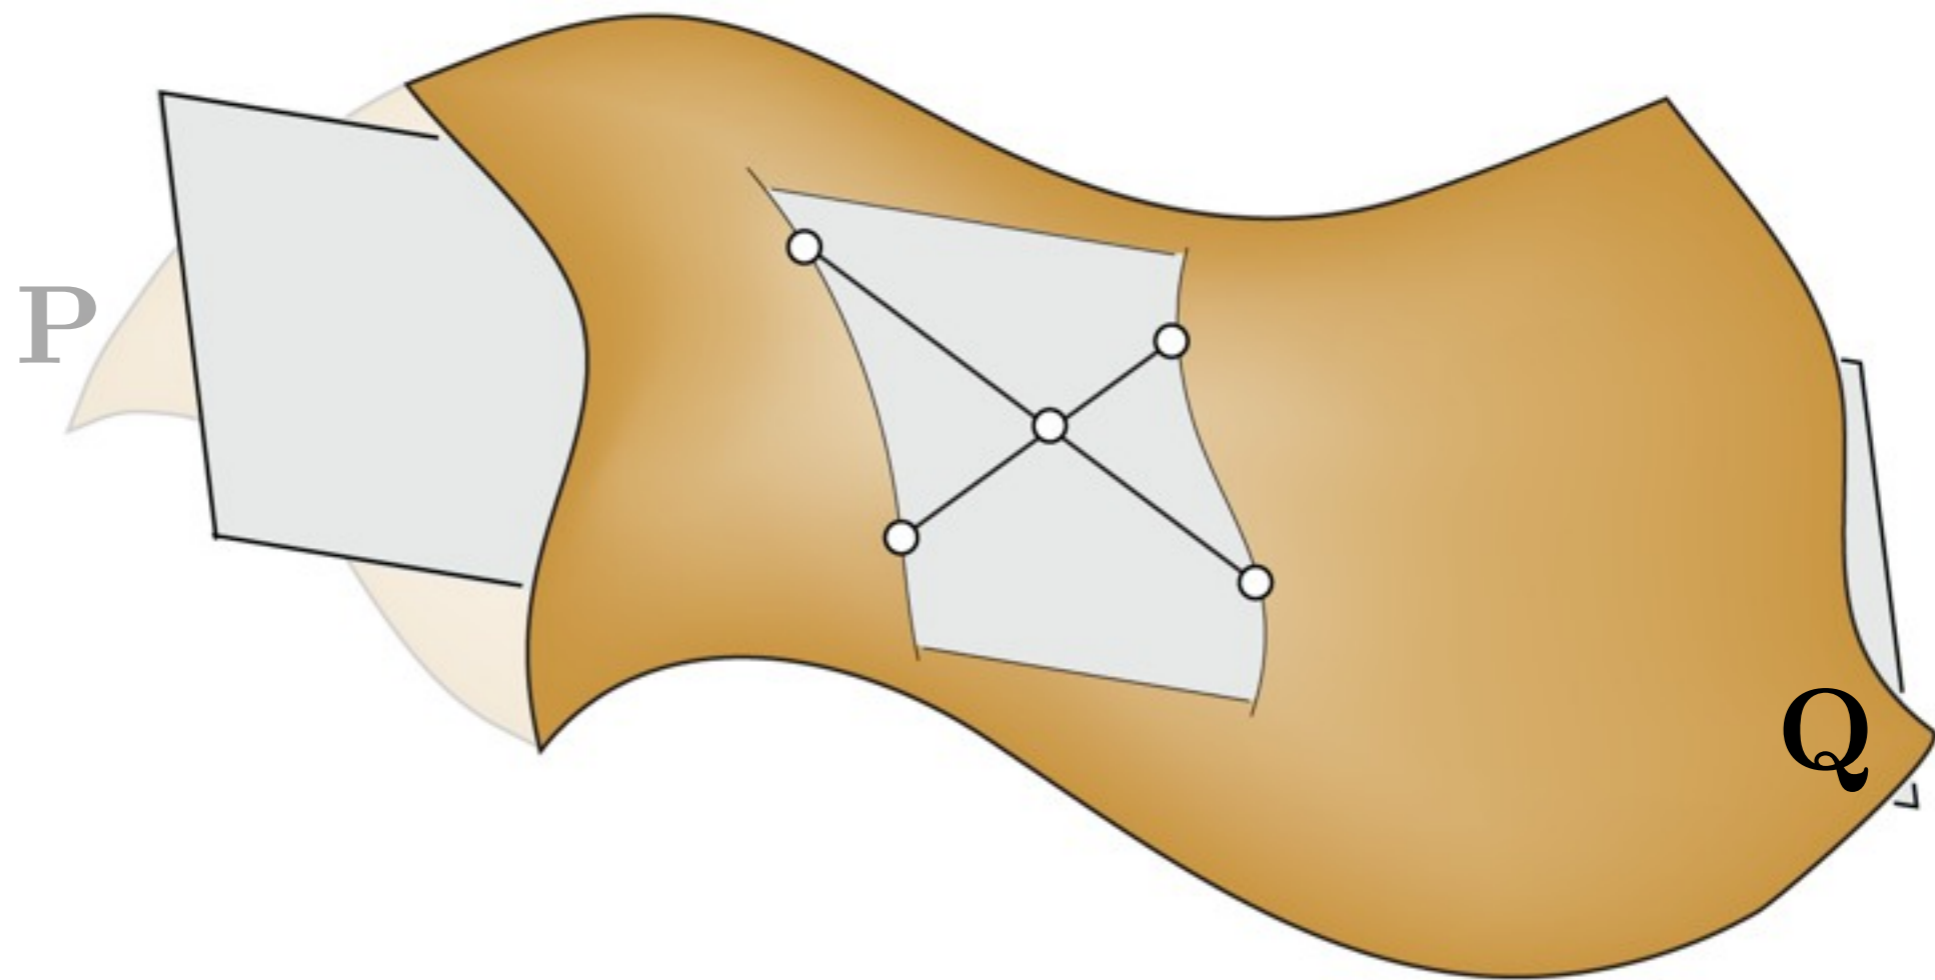

$$r_1 = \|\mathbf{a} - \mathbf{e}\| / \|\mathbf{a} - \mathbf{b}\|$$

$$r_2 = \|\mathbf{c} - \mathbf{e}\| / \|\mathbf{c} - \mathbf{d}\|$$

Affine Invariance

Affine Invariance

Affine Invariance

Affine Invariance

$$\| \mathbf{a}' - \mathbf{e}' \| / \| \mathbf{a}' - \mathbf{b}' \| = r_1$$

$$\| \mathbf{c}' - \mathbf{e}' \| / \| \mathbf{c}' - \mathbf{d}' \| = r_2$$

Extracting Congruent 4-points

$\{a, b, c, d\}$

$\rightarrow e, r_1, r_2$

P

$a', b', r_1 \rightarrow e'$

$$r_1 = \frac{\|a'-e'\|}{\|a'-b'\|}$$

Extracting Congruent 4-points

Extracting Congruent 4-points

$\{a, b, c, d\} \equiv$
 $\{q_1, q_2, q_3, q_4\}$

FindCongruent

**For all the points arising using r_1
build an *approximate range-tree* (ANN)**

**For all the points due to r_2 ,
quickly lookup for neighbors using range-
tree**

Rigid Transformation

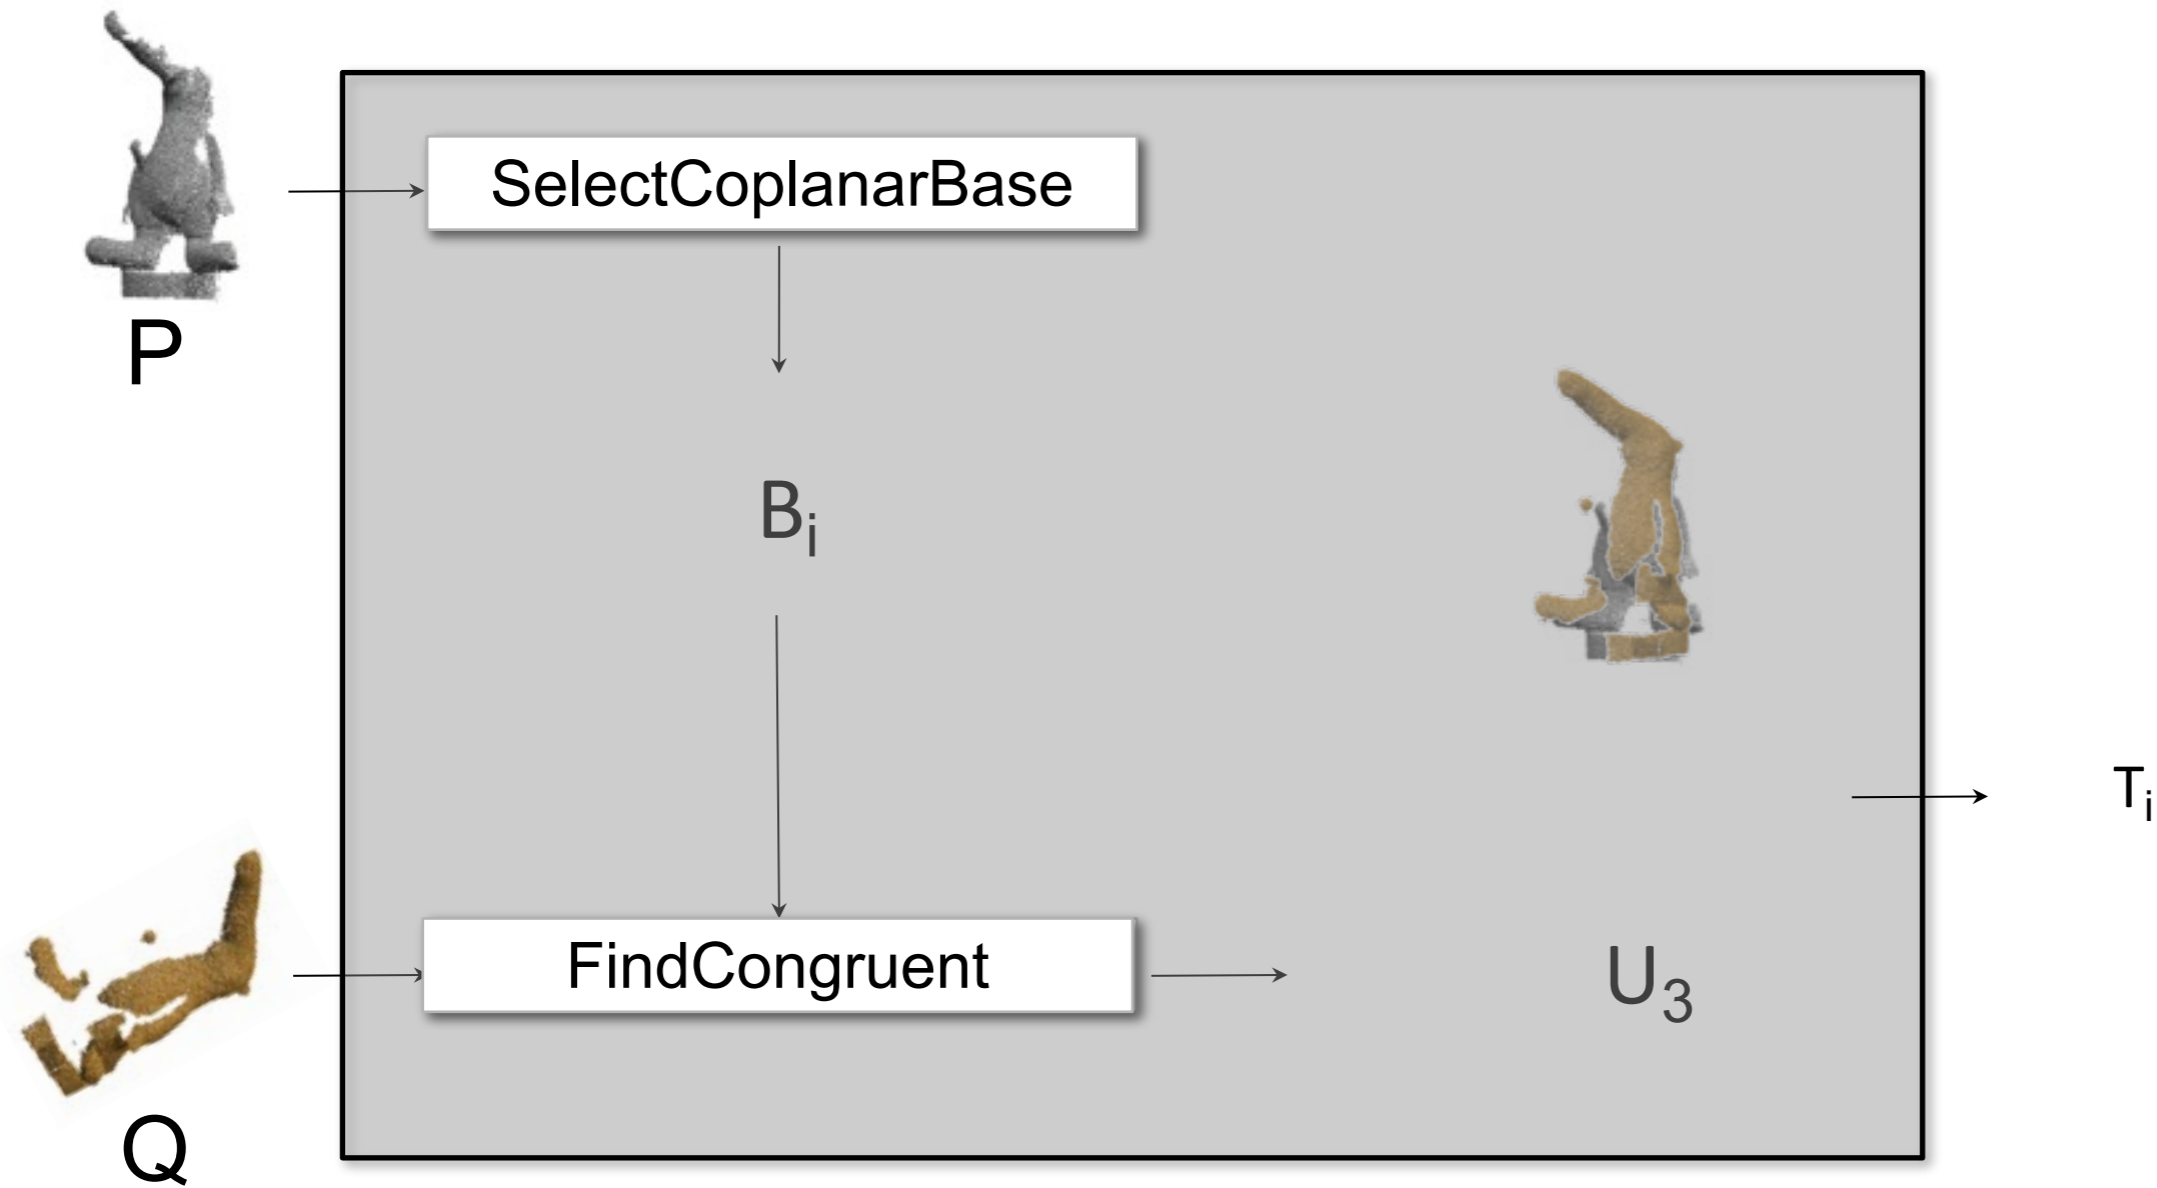

Euclidean distances are preserved

$$(\mathbf{q}_1, \mathbf{q}_2) \longrightarrow \|\mathbf{q}_1 - \mathbf{q}_2\| \approx \|\mathbf{a} - \mathbf{b}\|$$

SelectCoplanarBase

4PCS Algorithm

RANSAC iterations

SelectCoplanarBase

Select 3 points (from P) at random →
4th point to ensure (approx) coplanarity

Overlap amount →
decreasing guesses $f = 1, 0.5, 0.25, \dots$

Results

Effect of Noise

$\sigma = 0.5$

$\sigma = 2.0$

$\sigma = 4.0$
