# Backpropagation and Neural Networks

Slides adapted from: http://cs231n.stanford.edu/syllabus.html

Gerard Pons-Moll

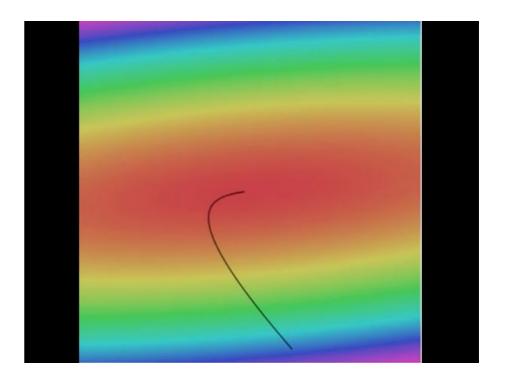

Where we are...

$$egin{aligned} s &= f(x;W) = Wx & ext{scores function} \ L_i &= \sum_{j 
eq y_i} \max(0, s_j - s_{y_i} + 1) & ext{SVM loss} \ L &= rac{1}{N} \sum_{i=1}^N L_i + \sum_k W_k^2 & ext{data loss + regularization} \end{aligned}$$

want  $\nabla_W L$ 

# Optimization

# Vanilla Gradient Descent

while True:

weights\_grad = evaluate\_gradient(loss\_fun, data, weights)
weights += - step\_size \* weights\_grad # perform parameter update

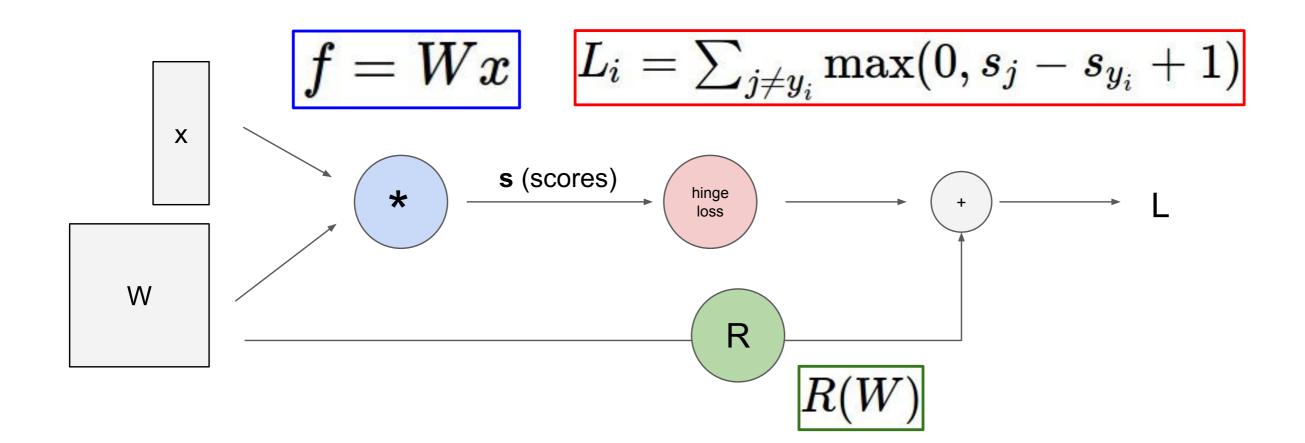

Landscape image is <u>CC0 1.0</u> public domain <u>Walking man image is <u>CC0 1.0</u> public domain</u> Gradient descent

$$rac{df(x)}{dx} = \lim_{h o 0} rac{f(x+h) - f(x)}{h}$$

**Numerical gradient**: slow :(, approximate :(, easy to write :) **Analytic gradient**: fast :), exact :), error-prone :(

In practice: Derive analytic gradient, check your implementation with numerical gradient

**Computational graphs**

Backpropagation: a simple example

$$f(x,y,z) = (x+y)z$$

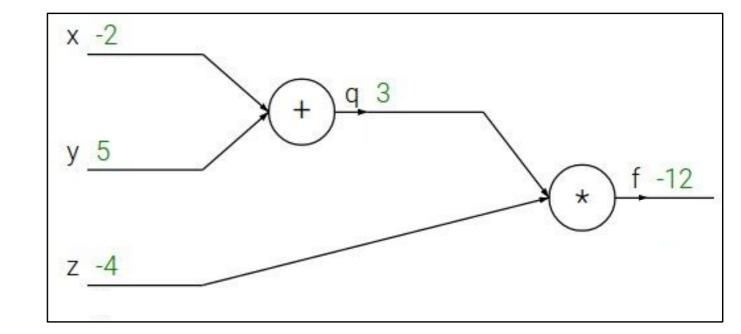

Backpropagation: a simple example

$$f(x,y,z) = (x+y)z$$

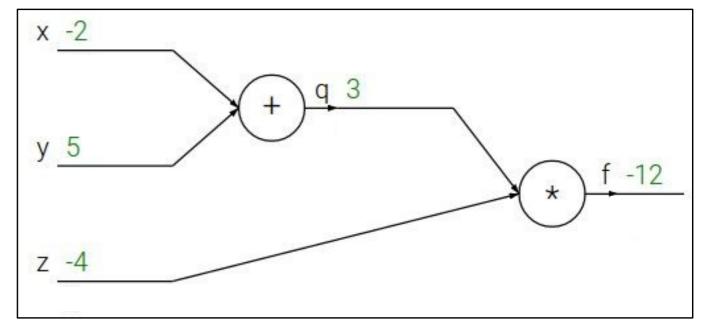

Backpropagation: a simple example

$$f(x, y, z) = (x + y)z$$
  
e.g. x = -2, y = 5, z = -4

Backpropagation: a simple example  

$$f(x, y, z) = (x + y)z$$
  
e.g.  $x = -2$ ,  $y = 5$ ,  $z = -4$   
 $q = x + y$   $\frac{\partial q}{\partial x} = 1$ ,  $\frac{\partial q}{\partial y} = 1$   
 $f = qz$   $\frac{\partial f}{\partial q} = z$ ,  $\frac{\partial f}{\partial z} = q$   
Want:  $\frac{\partial f}{\partial x}$ ,  $\frac{\partial f}{\partial y}$ ,  $\frac{\partial f}{\partial z}$ 

Backpropagation: a simple example  

$$f(x, y, z) = (x + y)z$$
e.g.  $x = -2$ ,  $y = 5$ ,  $z = -4$ 

$$q = x + y \quad \frac{\partial q}{\partial x} = 1, \frac{\partial q}{\partial y} = 1$$

$$f = qz \quad \frac{\partial f}{\partial q} = z, \frac{\partial f}{\partial z} = q$$
Want:  $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}$ 

Backpropagation: a simple example  

$$f(x, y, z) = (x + y)z$$
e.g.  $x = -2$ ,  $y = 5$ ,  $z = -4$ 

$$q = x + y \quad \frac{\partial q}{\partial x} = 1, \frac{\partial q}{\partial y} = 1$$

$$f = qz \quad \frac{\partial f}{\partial q} = z, \frac{\partial f}{\partial z} = q$$
Want:  $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}$ 

Backpropagation: a simple example  

$$f(x, y, z) = (x + y)z$$
e.g.  $x = -2$ ,  $y = 5$ ,  $z = -4$ 

$$q = x + y \quad \frac{\partial q}{\partial x} = 1, \frac{\partial q}{\partial y} = 1$$

$$f = qz \quad \frac{\partial f}{\partial q} = z, \frac{\partial f}{\partial z} = q$$
Want:  $\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}$ 

Backpropagation: a simple example  

$$f(x, y, z) = (x + y)z$$
  
e.g.  $x = -2$ ,  $y = 5$ ,  $z = -4$   
 $q = x + y$   $\frac{\partial q}{\partial x} = 1$ ,  $\frac{\partial q}{\partial y} = 1$   
 $f = qz$   $\frac{\partial f}{\partial q} = z$ ,  $\frac{\partial f}{\partial z} = q$   
Want:  $\frac{\partial f}{\partial x}$ ,  $\frac{\partial f}{\partial y}$ ,  $\frac{\partial f}{\partial z}$ 

Backpropagation: a simple example  

$$f(x, y, z) = (x + y)z$$
e.g.  $x = -2, y = 5, z = -4$ 

$$q = x + y \quad \frac{\partial q}{\partial x} = 1, \frac{\partial q}{\partial y} = 1$$

# In Assignment 1: Writing SVM / Softmax

#### Stage your forward/backward computation!

# Summary so far...

- neural nets will be very large: impractical to write down gradient formula by hand for all parameters
- backpropagation = recursive application of the chain rule along a computational graph to compute the gradients of all inputs/parameters/intermediates
- implementations maintain a graph structure, where the nodes implement the forward() / backward() API
- **forward**: compute result of an operation and save any intermediates needed for gradient computation in memory
- **backward**: apply the chain rule to compute the gradient of the loss function with respect to the inputs

# Next: Neural Networks

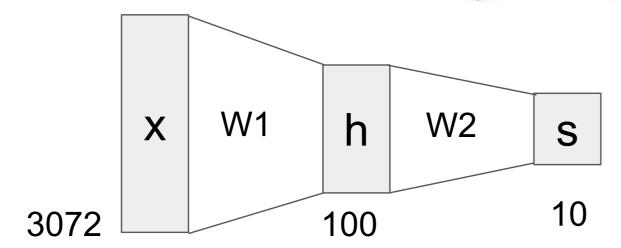

(**Before**) Linear score function: f = Wx

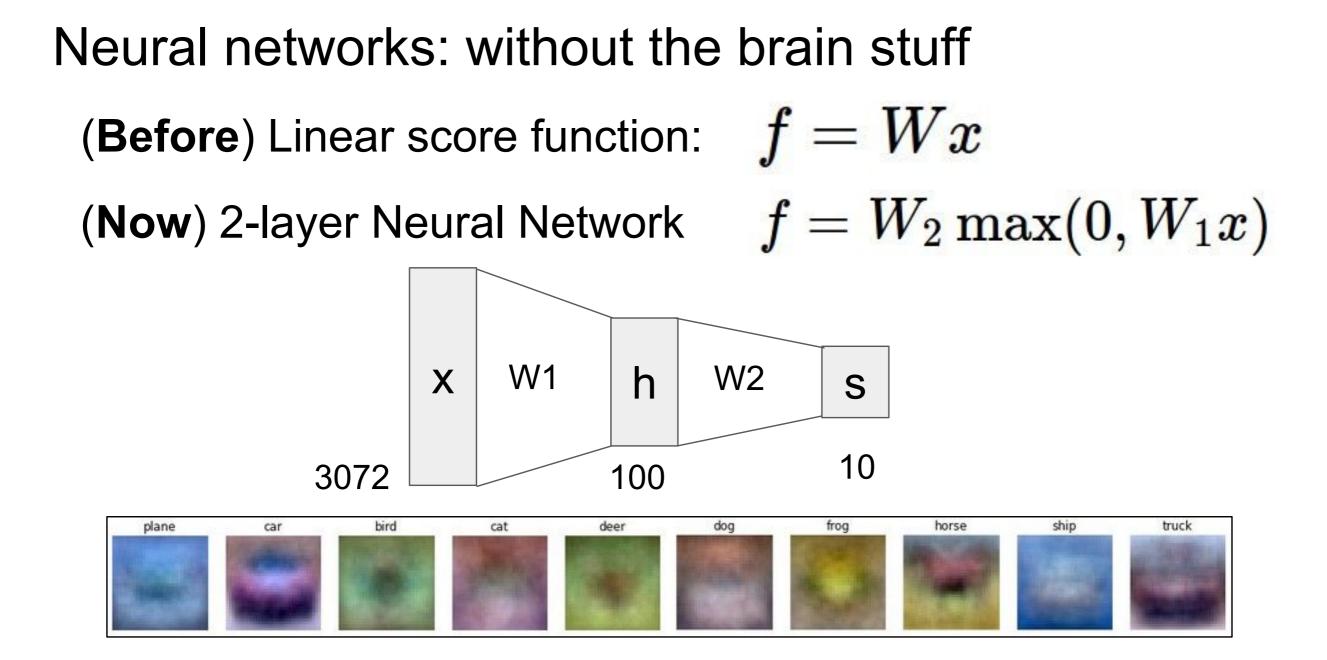

(**Before**) Linear score function: (**Now**) 2-layer Neural Network

$$egin{aligned} f &= Wx \ f &= W_2 \max(0, W_1 x) \end{aligned}$$

(**Before**) Linear score function: f = Wx

(Now) 2-layer Neural Network  $f = W_2 \max(0, W_1 x)$ 

(Before) Linear score function: f = Wx(Now) 2-layer Neural Network  $f = W_2 \max(0, W_1 x)$ or 3-layer Neural Network

 $f = W_3 \max(0, W_2 \max(0, W_1 x))$ 

#### Full implementation of training a 2-layer Neural Network needs ~20 lines:

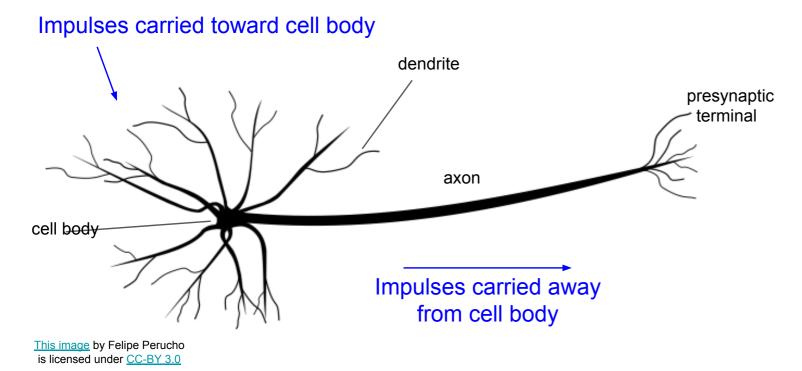

```
import numpy as np
 1
    from numpy.random import randn
 2
 3
    N, D_in, H, D_out = 64, 1000, 100, 10
 4
    x, y = randn(N, D_in), randn(N, D_out)
 5
    w1, w2 = randn(D_in, H), randn(H, D_out)
 6
 7
    for t in range(2000):
 8
      h = 1 / (1 + np.exp(-x.dot(w1)))
 9
      y_pred = h.dot(w2)
10
      loss = np.square(y_pred - y).sum()
11
      print(t, loss)
12
13
      grad_y_pred = 2.0 * (y_pred - y)
14
      grad_w2 = h.T.dot(grad_y_pred)
15
      grad_h = grad_y_pred.dot(w2.T)
16
      grad_w1 = x.T.dot(grad_h * h * (1 - h))
17
18
19
      w1 -= 1e-4 * grad_w1
      w2 = 1e - 4 * grad_w2
20
```

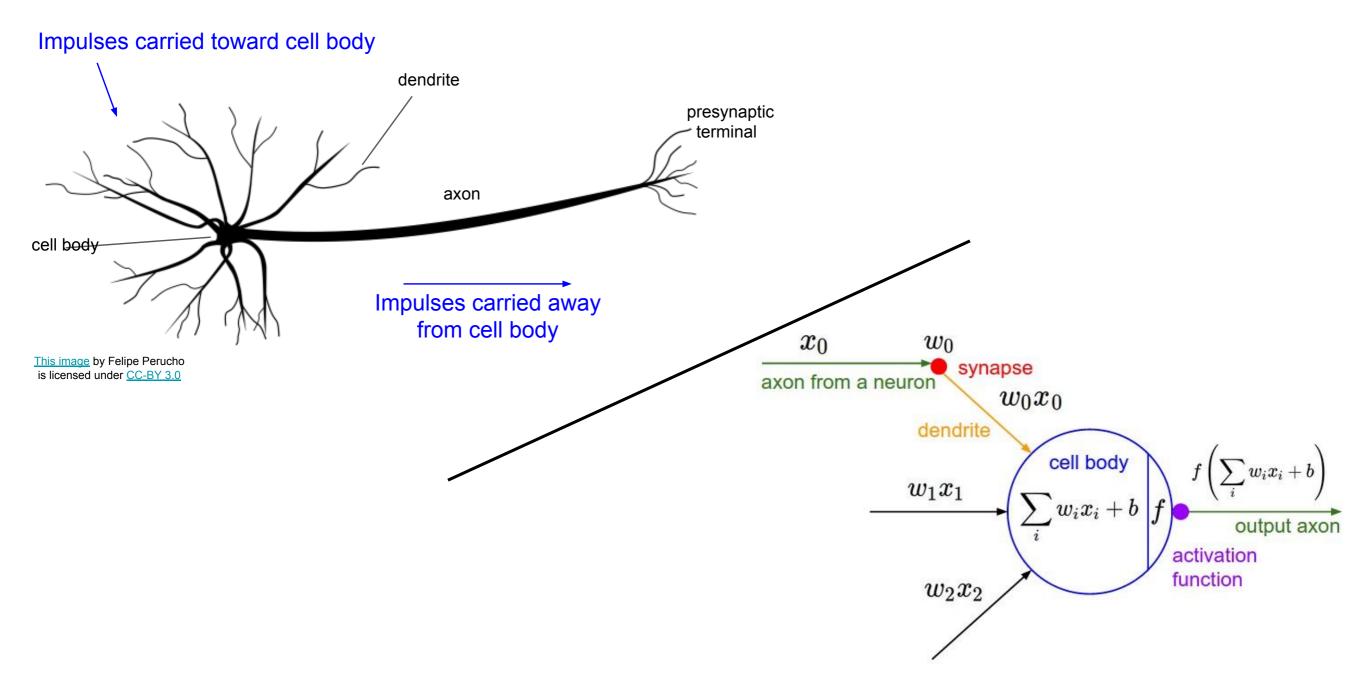

## In HW: Writing a 2-layer net

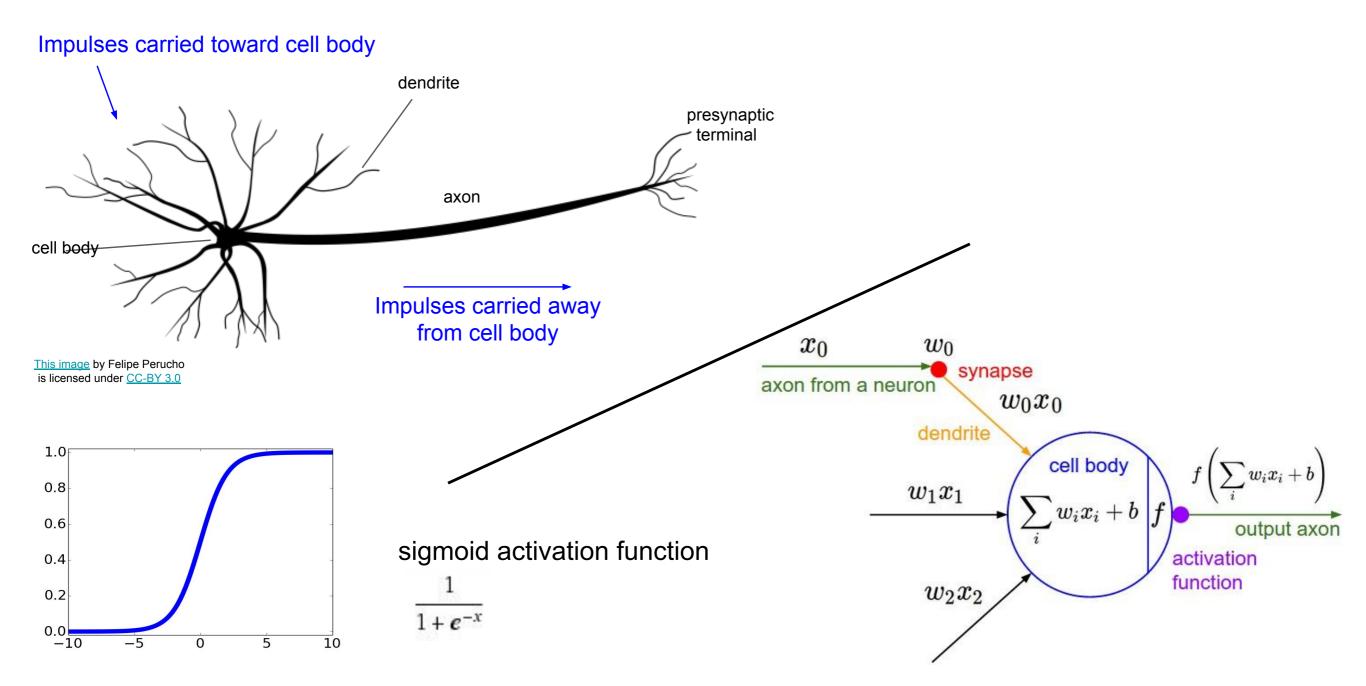

```
# receive W1,W2,b1,b2 (weights/biases), X (data)
# forward pass:
h1 = #... function of X,W1,b1
scores = #... function of h1,W2,b2
loss = #... (several lines of code to evaluate Softmax loss)
# backward pass:
dscores = #...
dh1,dW2,db2 = #...
dW1,db1 = #...
```

## Be very careful with your brain analogies!

#### **Biological Neurons:**

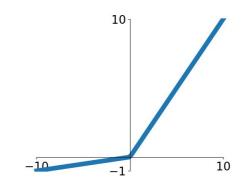

- Many different types
- Dendrites can perform complex non-linear computations
- Synapses are not a single weight but a complex non-linear dynamical system
- Rate code may not be adequate

[Dendritic Computation. London and Hausser]

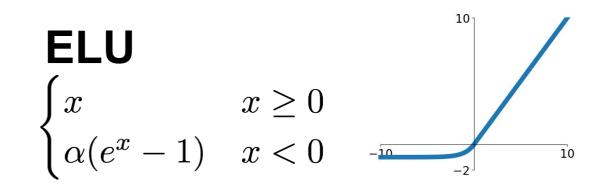

## Activation functions

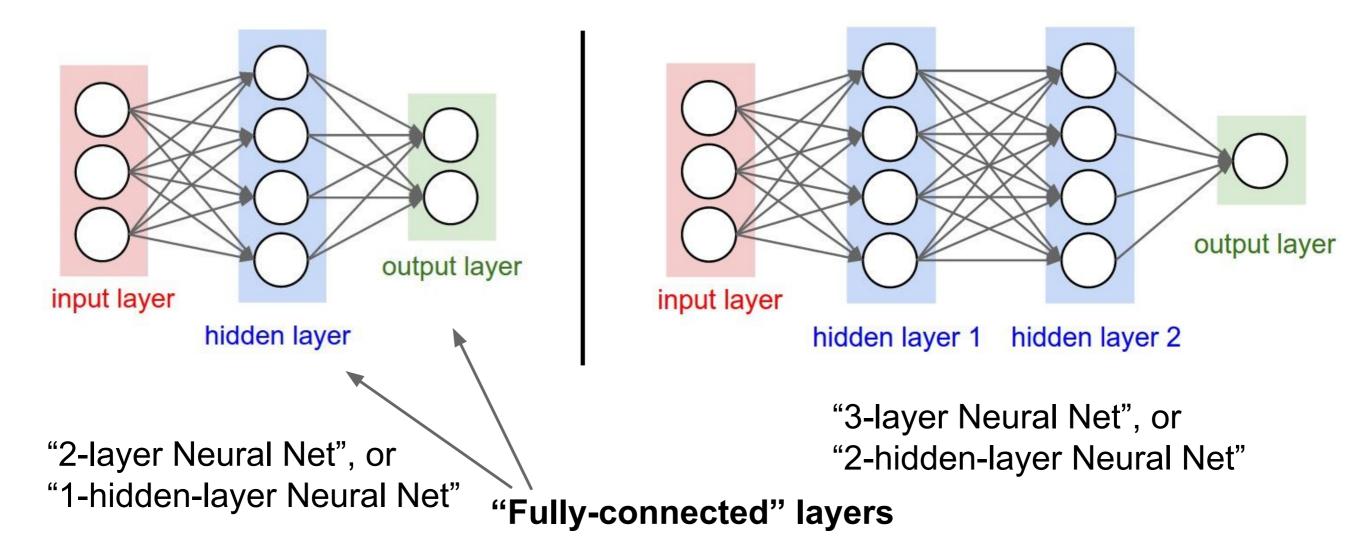

# Leaky ReLU $\max(0.1x, x)$

 $\begin{array}{l} \textbf{Maxout} \\ \max(w_1^T x + b_1, w_2^T x + b_2) \end{array}$ 

## Neural networks: Architectures

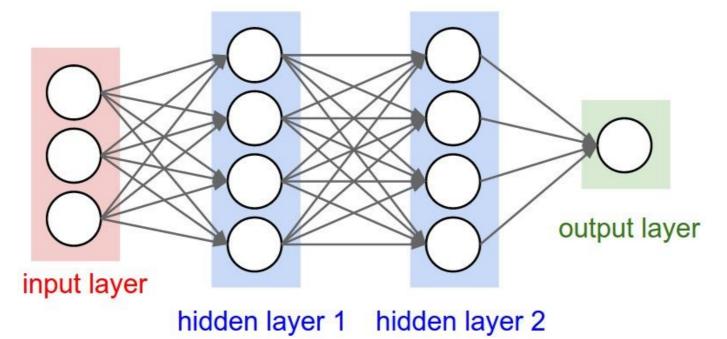

#### Example feed-forward computation of a neural network

```
class Neuron:
    # ...
    def neuron_tick(inputs):
        """ assume inputs and weights are 1-D numpy arrays and bias is a number """
        cell_body_sum = np.sum(inputs * self.weights) + self.bias
        firing_rate = 1.0 / (1.0 + math.exp(-cell_body_sum)) # sigmoid activation function
        return firing_rate
```

We can efficiently evaluate an entire layer of neurons.

#### Example feed-forward computation of a neural network

# forward-pass of a 3-layer neural network: f = lambda x: 1.0/(1.0 + np.exp(-x)) # activation function (use sigmoid) x = np.random.randn(3, 1) # random input vector of three numbers (3x1) h1 = f(np.dot(W1, x) + b1) # calculate first hidden layer activations (4x1) h2 = f(np.dot(W2, h1) + b2) # calculate second hidden layer activations (4x1) out = np.dot(W3, h2) + b3 # output neuron (1x1)

# Summary

- We arrange neurons into fully-connected layers
- The abstraction of a **layer** has the nice property that it allows us to use efficient vectorized code (e.g. matrix multiplies)
- Neural networks are not really neural
- Next time: Convolutional Neural Networks
